## Midterm Examination Solutions

### Winter 2019

Student Name: \_\_\_\_\_

Student ID Number: \_\_\_\_\_

Course Section: **BME 122**

Instructors: Dr. Igor Ivkovic

Date of Exam Winter 2019

Time Period 2:00pm-4:00pm

Duration of Exam 120 minutes

Pages (including cover) 15 pages (two scrap pages)

Exam Type Closed Book

**NOTE: No calculators or other electronic devices are allowed. Do not leave the exam room during the first 30 minutes and the last 15 minutes of the exam. Plan your time wisely to finish the exam on time.**

Question 1: (10 marks)	Question 2: (15 marks)	Question 3: (10 marks)	Question 4: (15 marks)
Total: (50 marks)			

---

## Useful Formulas

You may remove this page from the exam. If you do remove it, write your Student Number on it, and hand it in with your exam.

- For  $S = a_1 + (a_1 + d) + \dots + (a_n - d) + a_n$   
( $S$  is a series that goes from  $a_1$  to  $a_n$  in  $d$ -size increments),

$$S = n \left( \frac{a_1 + a_n}{2} \right) \quad (1)$$

- 

$$\sum_{i=k}^n 1 = (n - k + 1) \quad (2)$$

- 

$$\sum_{i=1}^n i = \left( \frac{n(n+1)}{2} \right) \quad (3)$$

- 

$$\sum_{i=1}^n i^2 = \left( \frac{n(n+1)(2n+1)}{6} \right) \quad (4)$$

- 

$$\sum_{i=0}^n r^i = \left( \frac{r^{n+1} - 1}{r - 1} \right) \quad (5)$$

- 

$$\log_b x = \frac{\log_c x}{\log_c b} \quad (6)$$

- 

$$x^{\log_b y} = y^{\log_b x} \quad (7)$$

- 

$$\log_b xy = \log_b x + \log_b y \quad (8)$$

- 

$$\log_b \frac{x}{y} = \log_b x - \log_b y \quad (9)$$

---

# 1 Question 1. Algorithm Complexity (10 marks)

(approx. 20 minutes)

## a. (4 marks)

Provide a code fragment in pseudocode that would exactly exhibit the runtime of:  $O(\log(n^2) + n \log(n))$  with no expression simplification.

For instance, for  $O(n)$  runtime, you could write the following:

```
loop from 1 to n {  
    call swap(a, b) that performs constant number of steps  
}
```

**Solution:**

```
int n = 45, step_count = 0;  
for (int k = 1; k < n * n; k = k * 2) { // 0.5 marks for k < n^2, 1 mark for k = k*2  
    ++step_count; // 0.5 marks for constant steps  
    cout << "step" << endl;  
}  
cout << step_count << endl; // corresponds to log_2(n^2)  
  
step_count = 0;  
for (int i = 0; i < n; ++i) { // 1 mark for this loop  
    for (int k = 1; k < n; k = k * 2) { // 1 mark for this loop  
        ++step_count;  
        cout << "step2" << endl;  
    }  
}  
cout << step_count << endl; // corresponds to n log_2(n)
```

---

**b. (6 marks)**

Let the runtime efficiency of an algorithm be defined as:

$$T(n) = 21\log_4(343) + 42\log_4(343) + 84\log_4(343) + \dots + 21\log_4(343)2^{n-1}.$$

Derive and express using Big-O notation a tight upperbound for  $T(n)$  using limits as  $n \rightarrow \infty$  or using the Big-O formal definition. **Solution:**

$$\begin{aligned} T(n) &= 21 \log_4(343) + 42\log_4(343) + 84\log_4(343) + \dots + 21\log_4(343)2^{n-1} = \\ &\quad [1 \text{ mark}] 21 \log_4(343)(1 + 2 + 4 + \dots + 2^{n-1}) = \\ &\quad [1 \text{ mark}] 21 \log_4(343) \sum_{i=0}^{n-1} 2^i = \quad (10) \\ &\quad [1 \text{ mark}] 21 \log_4(343) \frac{2^n - 1}{2 - 1} = \\ &\quad [0.5 \text{ mark}] 21 \log_4(343)2^n - 21 \log_4(343) = [0.5 \text{ mark}] O(2^n). \end{aligned}$$

**(Option A.)**

$$\lim_{n \rightarrow \infty} \frac{21 \log_4(343)2^n - 21 \log_4(343)}{2^n} = \lim_{n \rightarrow \infty} 21 \log_4(343) = \text{constant}.$$

Hence, it follows that  $T(n) = O(2^n)$ .

**(Option B.)**

We must show that  $21 \log_4(343)2^n - 21 \log_4(343) \leq K2^n$  for all  $n \geq n_0$ .

From  $21 \log_4(343)2^n - 21 \log_4(343) \leq K2^n$ , it follows that  $21 \log_4(343) - \frac{21 \log_4(343)}{2^n} \leq K$ .

Let  $n \geq n_0 = 1$ . It follows that as  $n \uparrow$ ,  $21 \log_4(343) - \frac{21 \log_4(343)}{2^n} \leq 21 \log_4(343) < 105$ .

Hence, for  $K = 105$  and  $n \geq n_0 = 1$ , it follows that  $T(n) = O(2^n)$ .

**Grading scheme:** 4 marks for the derivation of  $2^n$  as tight upper bound. 2 marks for the correct verification using limits as  $n \rightarrow \infty$  or using the Big-O formal definition.

---

## 2 Question 2. Algorithm Design (15 marks)

(approx. 40 minutes)

### a. (10 marks)

A friend sent you a message composed of letters  $b$ ,  $m$ , and  $e$ , where each letter appears at least once and in that order. For example, valid strings would be  $bmee$ ,  $bmmee$ , and  $bmeeee$ .

Unfortunately, this text message got distorted in transmission, and some letters may have been deleted and additional letters may have been inserted.

Write the function

```
bool has_original_message(string message, string garbled_text)
```

that will check if the original message, which you have later received through other means, is contained in the garbled text. If the message is contained in the text, then your function will return *true*. Otherwise, your function will return *false*.

For example, if the original message equals  $bmee$  and the text equals  $bmtttee$  then your function will return *true*. Similarly, if the original message equals  $bmmee$  and the text equals  $bcbbcmmdmeeee$  then your function will return *true*. However, if the original message equals  $bme$  and the text equals  $bttt$  then your function will return *false*.

You may assume that both strings will contain only lower-case letters; that the order of  $b$ ,  $m$ , and  $e$  appearances will not change (e.g., no  $m$ 's will appear before  $bs$ ); and that the garbled text will always be larger in size than the original message.

**Hint:** Use a temporary array of integers to record number of occurrences of  $b$ ,  $m$ , and  $e$ , respectively. When going through the message string, increment the corresponding position by one on each letter. When going through the garbled text, decrement the corresponding position by one when encountering  $b$ ,  $m$ , and  $e$ , respectively. Use the temporary array at the end to check if any of its elements are still greater than zero.

You may utilize operations of any of the abstract data types (ADTs) discussed in class so far, such as List ADT, without implementing the details. You may also write your function in pseudocode without focusing on syntactic details (e.g., you may write “*for*  $i = 0$  to  $(n-1)$ ”), but you need to specify each step and each function call unambiguously. To access string elements, you may use the  $str[index]$  operator. To access string size, you may use  $str.size()$ .

For full marks, the run-time performance of your algorithm needs to be  $O(n + m)$  where  $n$  is the size of the original message and  $m$  is the size of the garbled text. That is, you may iterate through each string in its own loop but those loops cannot be nested. For partial marks, the run-time performance of your algorithm can be worse than linear (e.g.,  $O(n^2)$ ). [The amount of partial marks awarded will be decided when grading.]

---

**Solution:**

```
// PURPOSE: Checks if message is contained within garbled text
//   INPUTS: message - message string to be found
//           garbled_text - text within which the message may be contained
//   RETURNS: true, if the message is found within the garbled_text string
//           false, otherwise
bool has_original_string_bme(string message, string garbled_text) {
    // initialize variables
    bool contains_original = true;
    vector<int> data_count(26, 0);

    // iterate through the message string
    // increment corresponding positions in data_count
    for (unsigned int index = 0; index < message.size(); index++) { [3 marks]
        if (message[index] != 'b' && message[index] != 'm' && message[index] != 'e')
            return false;
        ++data_count[message[index] - 'a'];
    }

    // iterate through the garbled_text string
    // decrement corresponding positions in data_count
    for (unsigned int index = 0; index < garbled_text.size(); index++) { [3 marks]
        if (data_count[garbled_text[index] - 'a'] > 0)
            --data_count[garbled_text[index] - 'a'];
    }

    // iterate through the data_count vector
    // update contains_original if a value > 0 is found
    for (unsigned int index = 0; index < 26; index++) { [3 marks]
        if (data_count[index] > 0)
            contains_original = false;
    }

    // return contains_original value [1 mark]
    return contains_original;
}
```

**Grading scheme:** See above. Award up to 5 marks for the solutions that are worse than  $O(n + m)$ . Subtract marks for solutions that are very hard to read or understand, or that do not provide all the required code steps.

---

```
int main() {
    string message("bmee");
    string garbled_text("bmttteee");
    cout << "Testing bmee & bmttteee: ";
    cout << (has_original_string_bme(message, garbled_text) ?
                                                    "Match" : "No Match") << endl;

    // OUTPUT: Match

    message = "bbmmee";
    garbled_text = "bcbbccmmdmeeee";
    cout << "Testing bbmmee & bcbbccmmdmeeee: ";
    cout << (has_original_string_bme(message, garbled_text) ?
                                                    "Match" : "No Match") << endl;

    // OUTPUT: Match

    message = "";
    garbled_text = "";
    cout << "Testing  & : ";
    cout << (has_original_string_bme(message, garbled_text) ?
                                                    "Match" : "No Match") << endl;

    // OUTPUT: Match

    message = "bme";
    garbled_text = "bttt";
    cout << "Testing bme & bttt: ";
    cout << (has_original_string_bme(message, garbled_text) ?
                                                    "Match" : "No Match") << endl;

    // OUTPUT: No Match
```

---

**b. (5 marks)**

Once you have designed the algorithm, explain in natural language — not code — how would you comprehensively test the algorithm. That is, list ten or more test cases that you would use to ensure correctness of your algorithm and enhance its robustness. Group the test cases into categories and provide short description for each category.

For example, one of the test case given above could be explained as "test a scenario where the given message is not contained in the garbled text." You do not have to modify the code to pass the test cases.

**Solution:**

[Test for cases where message or garbled\_text is empty; 1 mark]

1. message is empty, garbled\_text is empty
2. message is empty, garbled\_text is not empty
3. message is not empty, garbled\_text is empty

[Test for cases where characters other than those specified are present; 1 mark]

4. message contains characters other than 'b', 'm', and 'e'
5. garbled\_text contains characters other than lower-case letters

[Test for arrangements other than those specified; 0.5 mark]

6. message contains 'b', 'm', and 'e' letters but in arrangements other than b+ m+ e+
7. garbled\_text contains 'b', 'm', and 'e' letters but in arrangements other than b+ m+ e+

[Test for cases where message and garbled\_text are of different relative sizes; 0.5 mark]

8. message is smaller than garbled\_text, neither is empty
9. garbled\_text is smaller than message, neither is empty
10. message and garbled\_text are of equal size, neither is empty

[Test for cases where message is contained in garbled text; no interleaving; 0.5 mark]

(e.g., bme and bmeing, bme and abmeing, bme and aingbme)

11. message is contained at the start of garbled text
12. message is contained at the end of garbled text
13. message is contained in garbled text but not at the start or at the end

[Test for cases where message is contained in garbled text; some interleaving; 0.5 mark]

(e.g., bmee and bmieeing, bmee and abbimeeing, bmee and aingbbmdee)

14. message is contained at the start of garbled text with some character interleaving
15. message is contained at the end of garbled text with some character interleaving
16. message is contained midway in garbled text with some character interleaving

[Test for cases where message is contained in garbled text; all interleaving; 0.5 mark]

(e.g., bmee and bddmieeing, bmee and abbimfggeeing, bmee and aingbbffggmddee)

17. message is contained at the start of garbled text with some character interleaving
18. message is contained at the end of garbled text with some character interleaving
19. message is contained midway in garbled text with some character interleaving

[Test for cases where message is not present in garbled text; 0.5 mark]

(e.g., bmee and adfg, bmee and bmfg, bmee and bmefg)

20. no characters from message are present in garbled text
21. some characters from message are present in garbled text
22. all but one character from message are present in garbled text

---

**Grading scheme:** If only the description or one test case with description are provided, award the marks as specified above. If the description + two or more test cases are provided, award 1 mark for that category. Other categories may be accepted as appropriate. To qualify for full marks, at least ten distinct cases need to be provided with appropriate descriptions.

---

### 3 Question 3. Divide and Conquer Algorithms (10 marks)

(approx. 20 minutes)

Consider the following function:

```
void woof_star(vector<int>& data, int first, int last) {
    cout << "woof_star called with [" << first << ", " << last << "]" << endl;

    int partition_size = (last - first) / 5;

    if (last <= first + 1) {
        ++data[last];
        cout << "YAS!" << endl;
        return;
    }

    for (int index = (partition_size + 1); index <= (partition_size * 2); ++index) {
        cout << "WOOF ";
    }
    cout << endl;

    woof_star(data, first + 1, first + partition_size);
    woof_star(data, first + partition_size * 4 + 1, last);
}
```

**a. (3 marks)**

Draw the call tree for this function when *woof\_star(data, 18, 32)* is called.

```

                                (data, 18, 32)
                (data, 19, 20) [1 mark]          (data, 27, 32) [1 mark]
                        (data, 28, 28) [0.5 mark]          (data, 32, 32) [0.5 mark]
```

**Grading scheme:** See above.

---

**b. (7 marks)**

Let  $n = last - first$  for  $n \geq 0$  and let the recurrence relationship for this function be defined as:  $T(1) = a, T(n) = 2T(n/5) + n/5 + b$  for  $n > 1$ .

Solve the recurrence relationship by unrolling the recurrence (use back substitution), and give the  $T(n)$ 's order of growth in terms of the Big-O notation as a function of  $n$ . You may apply the heuristics once you have fully simplified the expression. Show all steps in deriving your solution.

**Solution:**

$$\begin{aligned} T(n) &= 2 T\left(\frac{n}{5}\right) + \frac{n}{5} + b = \\ &2 \cdot 2 T\left(\frac{n}{5^2}\right) + 2 \frac{n}{5^2} + \frac{n}{5} + 2b + b = \\ &2 \cdot 2 \cdot 2 T\left(\frac{n}{5^3}\right) + 2^2 \frac{n}{5^3} + 2 \frac{n}{5^2} + \frac{n}{5} + 4b + 2b + b = \\ &\dots = 2^i T\left(\frac{n}{5^i}\right) + \frac{n}{5} \sum_{j=0}^{i-1} \left(\frac{2}{5}\right)^j + b \sum_{j=0}^{i-1} 2^j = \\ &2^i T\left(\frac{n}{5^i}\right) + \frac{n}{5} \frac{\left(\frac{2}{5}\right)^i - 1}{\frac{2}{5} - 1} + b(2^i - 1) = \\ &2^i T\left(\frac{n}{5^i}\right) + \frac{n}{3} \left(1 - \left(\frac{2}{5}\right)^i\right) + b(2^i - 1) \end{aligned} \tag{11}$$

When  $\frac{n}{5^i} = 1$ , let  $i = c$ . It follows that  $\frac{n}{5^c} = 1$  and  $n = 5^c$ , so  $c = \log_5(n)$ .

From there,

$$\begin{aligned} T(n) &= 2^i T\left(\frac{n}{5^i}\right) + \frac{n}{3} \left(1 - \left(\frac{2}{5}\right)^i\right) + b(2^i - 1) = \\ &2^{\log_5(n)} T(1) + \frac{n}{3} \left(1 - \left(\frac{2}{5}\right)^{\log_5(n)}\right) + b(2^{\log_5(n)} - 1) = \\ &n^{\log_5(2)} a + \frac{n}{3} \left(1 - \left(\frac{2^{\log_5(n)}}{5^{\log_5(n)}}\right)\right) + b(n^{\log_5(2)} - 1) = \\ &n^{\log_5(2)} a + \frac{n}{3} \left(1 - \left(\frac{n^{\log_5(2)}}{n}\right)\right) + b(n^{\log_5(2)} - 1) = \\ &\left(a + b - \frac{1}{3}\right)n^{\log_5(2)} + \frac{n}{3} - b = \\ &O(n). \end{aligned} \tag{12}$$

**Grading scheme:** 1 mark for the initial steps, 2 marks for derivation and simplification of the general form, 1 mark for the computation of  $c = \log_5(n)$ , 2 marks for the application of  $c = \log_5(n)$  and full simplification, and 1 mark for the derivation of  $O(n)$ .

---

## 4 Question 4. Data Structure Design (15 marks)

(approx. 40 minutes)

We are designing a mobile app for a service similar to Netflix that will offer a subscription-based access to training content authored by our company. The app will allow users to create a list of their favourite viewing items that are offered by the service. For each favourite item, the app will store the unique item ID as an unsigned integer, item name as a string, item rating as an integer that represents the number of stars (from one star to five stars in one-star increments), item category as a string (e.g., data analytics, healthcare), and user-defined notes as a string.

- a. (4 marks) As the reference model for our design, we will make use of the **doubly linked list from Lab Assignment #2** where *FavItem* objects will be managed by the *FavsManager*. *FavsManager* needs to include **pointers to first and last elements**. To that end, complete the C++ class declaration provided below to make *FavItem* and *FavsManager* function. For *FavItem*, include the empty constructor, parametric constructor, and *operator ==*. For *FavsManager*, include the empty constructor, *void push\_back(FavItem& new\_item)*, and *void pop\_nth\_from\_end(unsigned int index)*. Provide only method signatures at this point and no method implementation. Do not forget to include the *size* variable.

**Solution:**

```
class FavItem {
    unsigned int itemID;
    friend class FavsManager;

    // fill in other required member attributes and methods below
    // members should be declared as public or private as appropriate
    string item_name, item_category, user_notes; // [0.5 mark] for attributes
    unsigned int rating;
    FavItem* prev; // [0.5 mark]
    FavItem* next; // [0.5 mark]

public:
    FavItem(); // [0.5 mark] for the constructors and operator==
    FavItem(unsigned int new_itemID);
    FavItem(unsigned int new_itemID, string new_item_name, unsigned int new_rating,
             string new_item_category, string new_user_notes);
    bool operator==(const FavItem& rhs) const;
};

class FavsManager {
    // fill in other required member attributes and methods below
    // members should be declared as public or private as appropriate
    FavItem* first; // [0.5 mark]
    FavItem* last; // [0.5 mark]
    int size; // [0.5 mark]
public:
    FavsManager(); // [0.5 mark] for service methods
    int get_size() const;
    void print();
    void push_back(FavItem& new_item);
    void pop_nth_from_end(unsigned int index);
};
```

- 
- b. (5 marks) Implement the method `void push_back(FavItem& new_item)` that will insert the referenced *FavItem* element at the end of the list using dynamic memory, and update the *size* variable. You must use exact C++ syntax for this function. **Solution:**

```
void FavManager::push_back(FavItem& new_item) {
    // allocate new element on the heap [0.5 mark]
    FavItem* new_element = new FavItem(new_item);

    // base case: empty list [1 mark]
    if (!first) {
        first = last = new_element;

    // general case: non-empty list
    } else {
        FavItem* cur = first;
        while (cur) { // check for duplicates
            if (cur->itemID == new_item.itemID)
                return;
            else
                cur = cur->next;
        }

        // update relevant pointers
        last->next = new_element; // [1 mark]
        new_element->prev = last; // [1 mark]

        // update last element
        last = new_element; // [1 mark]
    }

    // update size [0.5 mark]
    ++size;
}
```

**Grading scheme:** See above.

- c. (6 marks) Implement the method `void pop_nth_from_end(unsigned int index)`. The method will take as input an `index` value, remove the index-th element from the end of the list, free up its memory, and update the `size` variable.

For example, if the list stores the following item IDs:  $141 \rightarrow 123 \rightarrow 15$  and if `index = 2`, then the function will remove the second item from the end and produce the following list:  $141 \rightarrow 15$ . If the `index = 0` or if `index` exceeds list size, then no change will be made.

You must use exact C++ syntax for this function. You may only use `iostream` and `string` libraries in your implementation and no other external libraries. However, you may write helper functions of your own. You also need to document your code and explain the rationale for key steps. **Solution:**

```
void FavManager::pop_nth_from_end(unsigned int index) {
    // check for invalid index [0.5 mark]
    if (index == 0 || index > size)
        return;
    // base case: index == 1 && size == 1 [1 mark]
    if (index == 1 && size == 1) {
        delete last;
        first = last = NULL;
    }
    // base case: index == 1 && size > 1 [1 mark]
    } else if (index == 1) {
        FavItem* cur = last;
        last->prev->next = NULL;
        last = last->prev;
        delete cur;
    }
    // base case: index == size && size > 1 [1 mark]
    } else if (index == size) {
        FavItem* cur = first;
        first->next->prev = NULL;
        first = first->next;
        delete cur;
    }
    // general case: index < size && size > 1
    } else {
        unsigned int count = 1;
        FavItem* cur = last;
        // find the corresponding index [1 mark]
        while (count < index && cur) {
            cur = cur->prev;
            ++count;
        }
        // update the prev and next pointers [1 mark]
        cur->prev->next = cur->next;
        cur->next->prev = cur->prev;
        delete cur;
    }
    // update size [0.5 mark]
    --size;
}
```

**Grading scheme:** See above.
